

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Berlepsch on some Neotropical Birds in the U. S. National Museum.—In a paper in the 'Proceedings' of the U. S. National Museum * Count von Berlepsch publishes his determinations of various specimens submitted to him for examination. They represent 28 species of Hummingbirds, and 6 species of Passerine birds, the specimens of the latter being types of species described by Mr. George N. Lawrence. The paper comprises much interesting comment on questions of nomenclature and the status of alleged species. *Uranomitra quadricolor* Elliot (*nec Vieillot*) is named *U. ellioti*.—J. A. A.

Stejneger on European Titmice.—Dr. Stejneger, in a paper on the European Marsh-tits, † finds three forms of Marsh-tits in the Scandinavian Peninsula, one of which, *Parus colletti*, he describes as new. The relationship of the three forms is considered at length. In a paper on the European Crested Titmice, ‡ he finds the Scandinavian form separable from that of central Europe. To the former he restricts the name *Parus cristatus* Linn., and adopts *Parus mitratus* Brehm for the form of central Europe, which may, he says, prove to be only a geographical race of *P. cristatus*.—J. A. A.

Stejneger on Hawaiian Birds.—Two additional § collections received at the U. S. National Museum from Mr. Valdemar Knudsen form the basis of two recent papers by Dr. Stejneger. The first ¶ contains extended comment on 10 species of water birds, one of which, *Puffinus knudseni*, is described as new. *Anas wyvilliana* is described at length, and its relationships defined, its nearest affine proving to be *A. aberti* Ridgw. of northwestern Mexico, as previously pointed out by Mr. Ridgway.

The collection treated in the second paper ¶ was made wholly in the island of Kauai, and numbers about 20 species, of which about one-half are land birds. *Oreomyza wilsoni* is described as new. Further material shows that *Puffinus knudseni* is not separable from Mr. Salvin's *P. cuneatus*, described only a few months before *P. knudseni* was published.—J. A. A.
